

ABSTRACT

- 5 A method and apparatus for screening access to personal contact information in an electronic or telephonic database composed of the querying party generating a query signal to obtain personal contact information which is received by a bridge website server, the bridge website server sending a query notification signal to a listing party so as to inform him or her of the existence of a query for personal contact information and the identity of the querying party,
- 10 the listing party generating a consent/no consent signal sent to the bridge website server indicating which personal contact information is to be revealed to the querying party, and a personal contact information signal which brings the querying party the personal contact information of the listing party that the listing party wanted to be made available.
